Endeavour (1971) and Apollo 16 (1968) were the last lunar missions. Since the 1970s, the focus of lunar exploration has shifted from scientific discovery to resource utilization and human exploration. The Artemis program, led by NASA, aims to return humans to the Moon by 2025 and establish a sustainable lunar presence. This involves developing advanced technologies, such as lunar landers, rovers, and habitats, and conducting extensive research on the Moon's geology, resources, and environment. The Artemis program is a key component of NASA's broader vision for deep space exploration, which includes sending humans to Mars and beyond.

Enfermagem em pediatria: a importância da atuação multidisciplinar no cuidado ao recém-nascido prematuro
